

## "NCO" Drywall Isolation

### Installation

#### Vibro-FS

Inside the specially modulated receptor can be installed wooden batten or metal profile of floating walls (steel frame, metal studs etc.) and fixed on the lateral flaps with bolts. Vibro-FS can be fixed on the floor or the wall with expansion bolts or inox nails.

#### Vibro-WS

Vibro-WS are installed on floor or ceiling metal profiles (U-runner with width 75 or 100mm) in correspondence to the C-studs or could also be installed unified, under the U-runner. They can be fixed on the profiles with bolts and on floor or ceiling with expansion bolts.

The void must be filled with sound absorption material (e.g. rockwool). Part or all of base's lateral flaps, of Vibro-WS, can be cut easily due to their incisions, for applications with smaller thickness (e.g. single gypsumboard) than the flap's length.
